

If Omnicopy (which is a product of the Brother Corporation) fails to load, or if you find it keeps re-loading, you may need to delete the Brother folder and load Omnicopy from scratch? To do that you can just open up your file explorer (like your C: drive) and put the following string in the address bar:

C:\Users\%userprofile%\AppData\Local and delete the 'Brother' folder:

where you would replace %userprofile% with your user name on the computer.
